```
The invention describes a transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the complement of the specification or its complement. The method of the content of the specification or its complement. The method of the content of the specification or its complement. The method of the content of the sensitivity; disease resistance; sugar sensing; early or late flowering; altered flower structure, change in stem bifurcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes; reduced ectopic trichome development; altered stem morphology; increased root growth; increased root hairs; altered seed development; altered cell proliferation or cell differentiation; rapid development; altered cell proliferation or cell differentiation; rapid development; content sense in root anthocyanins; increase in seeding or plant size; leaf morphology; seed morphology; seed biochemistry; increase in root anthocyanins; increase in plant can seed biochemistry; increase in root anthocyanins; increase in plant transgenic plant, polynucleotides and polypeptides are useful in bioinformatic search methods. This sequence represents a plant transgenic plant related polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences, useful in bioinformatic search methods.
branching pattern; apical dominance; trichome; stem morphology; root growth; root hair; seed development; cell proliferation; cell differentiation; premature senescence; necrosis; plant size; leaf morphology; seed morphology; seed blochemistry; root anthocyanin; plant anthocyanin; light response; shade avoidance; bloinformatic; transcription factor; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 1983 BP; 585 A; 464 C; 434 G; 500 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (JIAN)
```

New transgenic plant, useful in developing phenotypes with altered or improved characteristics or traits.

Claim 1; SEQ ID NO 637; 213pp; English.

complementary a sequence encoding a polypopetide, that initiates transcription (i.e. a transcription factor) from Arabidopsis, Soybean, candertain a sequence encoding a polypopetide, that initiates transcription (i.e. a transcription factor) from Arabidopsis, Soybean, and the polypopetide transcription (i.e. a transcription factor) from Arabidopsis, Soybean, AbDO03520 or ADDO03520 and ADDO03550 and ADDO03 invention relates to a transgenic plant comprises a recombinant thalecress transcription factor of the invention.

New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.

Claim 1; SEQ ID NO 1174; 510pp; English

The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADOS1534-ADOS378). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant campared to a sequence can be used to produce transgenic plant compared to a latered trait selected from increased tolerance to abiotic stress, increased dermination in cold, increased tolerance to cheat, increased colorance to lateral, increased colorance to low phosphate conditions, increased tolerance to freezing conditions, increased tolerance to freezing conditions, increased tolerance to freezing conditions, increased tolerance to descent including chugal disease and particularly Expsiphe, Fusarium and Botrytis, increased tolerance to multiple fungal pathogens, increased tolerance to gruphosate, increased tolerance to multiple fungal pathogens, increased tolerance to conditions, increased tolerance to multiple fungal pathogens, increased tolerance to multiple fungal pathogens, increased tolerance to conditions, increased tolerance to multiple fungal pathogens, increased tolerance to multiple fungal pathogens, increased tolerance to complete the carbon/nitrogen sensing, early flowering) attered seme morphology, altered sugar sensing, antiple fungal pathogens attered shoot meristem development, altered branching pattern, consider seme morphology, altered secular tissue structure, reduced apical dominance, altered development, altered seed richome etructure, altered coll profileration, alow growth, altered coll profileration, altered development, altered seed programmed cell profileration, altered development, altered seed programmed cell garmiation, alow growth, fast growth, altered cell profileration, altered development, altered senescence, abnormal embryo development, altered senescence, abnormal embryo development, altered seed profileration, altered seed seed seed seed seed seed, increased leaf wax, increased leaf fatty acide, altered seed coloration, altered seed seed s ftp.wipo.int/pub/published_pct_sequences format directly from WIPO at electronic

Sequence 418, Application US/09640211A

Sequence 418, Application US/09640211A

Patent No. 6833446

GENERAL INFORMATION:

APPLICANT: Wood, Marion

APPLICANT: Shenk, Michael A.

APPLICANT: GONDOSITION:

TITLE OF INVENTION: Compositions and Methods for the

TITLE OF INVENTION: Modification of Gene Transcription

FILE REFERENCE: 11000.1021C1U

CURRENT APPLICANT: 8000.021C1U

CURRENT FILING DATE: 2000-08-16

NUMBER OF SEQ ID NOS: 2368

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 418

LENGTH: 323
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ; Sequence 37 Application US/09640211A; Patent No. 683346; Patent No. 683346; GENERAL INFORMATION: APPLICANT: Wood, Marion; APPLICANT: Shenk, Michael A. i Sequence 111, Application US/09640211A
i Sequence 111, Application US/09640211A
i Patent No. 6833446
i GENERAL INFORMATION:
i APPLICANT: Wood, Marion
i APPLICANT: Shenk, Michael A.
i APPLICANT: Glenn, Matthew
i TITLE OF INVENTION: Compositions and Methods for the
i TITLE OF INVENTION: Madification of Gene Transcription
i FILER REFERENCE: 11000.1021C1U
i CURRENT APPLICATION NUMBER: US/09/640,211A
i CURRENT APPLICATION NUMBER: 2000-08-16
i NUMBER OF SEQ ID NOS: 2368
i SOFTWARE: FastSEQ for Windows Version 4.0
i LENGTH: 380
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 380

Patent No. 6833446

GENERAL INFORMATION:
APPLICANT: Wood, Marion
APPLICANT: McGrath, Annette
APPLICANT: McGrath, Annette
APPLICANT: Glenn, Matthew
TITLE OF INVENTION: Compositions and Methods for the
TITLE OF INVENTION: Modification of Gene Transcription
FILE REFERENCE: 11000.1021C1U
CURRENT APPLICATION NUMBER: 2000-08-16
NUMBER OF SEQ ID NOS: 2368
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 1845
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-09-640-21A-351

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

supplier: Solanum tuberosum var. Kennebec plants were
grown from cuttings on a 16hr light/8 hr dark cycle at 25
C for 3-4 weeks. Abjotic stress conditions were applied to
the soil with 150 mM NaCl and tissues were harvested at
following application of the salt stress (leaves: 2hr,
6hr, 12hr, 1d, 2d, and 4d; roots:2hr, 6hr, 12hr, and 2d).
Set 2 were grown under the standard conditions and then
were water stressed by withdrawal of further watering
applications. Drought stressed plants were harvested after
cessation of watering (leaves: 3d, 5d, and 7d; roots:3d
and 5d). Set 3 were grown under the standard conditions
and then were cold stressed by placement at 4 C. Cold
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,

and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d. Set 4 were grown under the standard conditions and then were heat stressed by placement at 35 C. Heat stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d and 4d and heat-stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d. RNA was isolated from all tissues and equal RNA from each tissue and stress was pooled to construct the cDNA library. RNA sample."

Xhol; Tissue supplied by Christian Bachem and Richard
Visser (Department of Plant Breeding, Wageningen
University, The Netherlands); sequencing by The Institute
for Genomic Research. The cSTA libraries will attempt to
capture the induction and initiation/initial growth of the
tuber in an in vitro system as described in Bachem et al.
(Plant Journal, 1996). Small microtubers develop from
axillary buds attached to stem explants when placed on a
high sucrose medium (10%). Visible morphological changes
occur synchronously at day five in the axillary buds.
first library, cSTA (1-20) consists of axillary buds
harvested on days 1-3. This targets those genes involved
in induction of the microtubers. The following libraries,
cSTA (21-40) and cSTA (41-60), capture genes involved in
tuber initiation and outgrowth. This library is noted as
P3 in Tanksley lab notebooks."

/clone lib="tomato fruit red rice, TAMU"
/note="Vector: pBlueScript SK(-); Site_1: EcoR1; Site_2:
Xho1; supplier: Glovannoni; Fruit were tagged at the
breaker stage (first sign of lycopene accumulation on the
blossom end of the fruit) and harvested 7 days
post-breaker (fully red-ripe), 10 days post breaker, and
20 days post-breaker (over-ripe), 20 day fruit which
showed external or internal signs of pathogenesis were
discarded. Fruit were cut in half and the seeds and
locules were discarded prior to freezing the pericarp."

/note="Wector: pBluescript SK(-); Site 1: EcoRI; Site_2:
Xhoi; Tissue supplied by Christian Bachem and Richard
Visser (Department of Plant Breeding, Wageningen
University, The Netherlands); sequencing by The Institute
for Genomic Research. The cSTA libraries will attempt to
capture the induction and initiation/initial growth of the
tuber in an in vitro system as described in Bachem et al.
(Plant Journal, 1996): Small microtubers develop from
axillary buds attached to stem explants when placed on a
high sucross medium (10%). Visible morphological changes
occur synchronously at day five in the axillary buds
first library, cSTA (1-20) consists of axillary buds
harvested on days 1-3: This targets those genes involved
in induction of the microtubers. The following libraries,
cSTA (21-40) and cSTA (41-60), capture genes involved in
tuber intiation and outgrowth. This library is noted as
P3 in Tanksley lab notebooks."

//clone_lib="Washington Navel orange cold acclimated
flavedo & albedo CDNA library"
//note="Vector: Lambda Uni-ZAP XR, excised phagemid;
Site_1: Ecoli Site_2: XhOI; Plants were grown in the
field at University of California, Riverside Agricultural
Operations since 1983. The scion was Washington Navel
orange and the rootstock Carizoc Citrange. Tissue from
mature fruit was harvested at mid-day in January 2002
during a cold spell, when pre-dawn temperatures were
approximately -2 to 2 degree C. Approximately 2 cm median
sections of the rind were excised in the field from
several fruits, then wrapped in aluminum foll and frozen
quickly in dry ice. Total RNA was extracted using a phenol
extraction procedure described in J. Japanese Soc. Hort.
Sci. (1996) 64:809-814. Poly(A) RNA was purified, a cDNA
library was made, and 1 million primary lambda cDNA
library was made, and 1 million primary lambda cDNA
library was made, and 1 million primary lambda cDNA
library was made, and 1 million primary lambda cDNA
library was made, and 1 million primary lambda cDNA
library was made, and 1 million primary lambda
kiverside (Fenton). Phagemids were plated, plasmid DNA
purified, cDNA clones archived, and DNA sequences
determined bi-directionally using an AB1530 at the
Arizona Genomics Institute, University of Arizona
(Collura, Feuerbacher, Kim, Kudrna, Wing, Yu).
Chromatogram files were transmitted to UC Riverside (by Wanamaker) using
the HarvEST pipeline (http://harvest.ucr.edu) to remove
vector and cloning oligo sequences and various
contaminants, and to trim to a high quality region.
Sequences that retained a phred 17 region of at least 100
bases were deposited to GenBank."

```
Site_2: XhoI; supplier: Boyce Thompson Institute, sequencing: The Institute for Genomic Research. Fruit were harvested at the breaker stage (first sign of lycopene accumulation on the blossom end of fruit). Fruit were cut in half and the seeds and locules were discarded prior to freezing the pericarp."
```
